                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Dp
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         the invention comprises nucleic acids (e.g. antisense oligonucleotides)
that down regulate the expression or inhibit the function of a receptor
for a neurite growth inhibitor, NOGO, prostaglandin DZ receptor (PTGDR),
Ikappa Kinase (IKK), or protein Kinase PKR. The nucleic acids of the
invention are useful for treating: cerebrovascular accident, central
nervous system (CMS) injury, spinal cord injury, ancer (e.g. melanoma,
lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,
restenosis or asthma), crohn's disease, diabetes, obesity, autoimmune
disease, lupus, multiple sclerosis, transplant/graft rejection,
ischaemia/reperfusion injury, glomerulomephritis, sepsis, and allergic
conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
nucleic acids of the invention are also useful for down-regulating the
cxpression of a target gene and as a diagnostic tool to examine genetic
drifts and mutations within diseased cells or to detect the presence of a
target RNA in a cell. The present RNA sequence represents a human IKK-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

The invention comprises nucleic acids (e.g. antisense oligonucleotides)
that down regulate the expression or inhibit the function of a receptor
that down regulate the expression or inhibit the function of a receptor
for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),
is kappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the
invention are useful for treating: cerebrovascular accident, central
nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
comprise or asthma), inflammatory disease (e.g. rheumatoid arthritis,
restences; or asthma), crohn's disease, diabetes, obesity, autoimmune
disease, lupus, multiple solarorsis, transplant/graft rejection,
conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
nucleic acids of the invention are also useful for down-regulating the
conditions of a target gene and as a diagnostic tool to examine genetic
drifts and mutations within diseased cells or to detect the presence of a
condition of a target gene and as a diagnostic tool to examine genetic
drifts and mutations within diseased cells or to detect the presence of a
conditions of the present RNA sequence represents a human IKK-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 human; cytokeratin; CK; LAMP; loop mediated isothermal amplification;

The invention relates to novel nucleic acid amplification primers for the detection of human cytokeratin (CK) 18, 19 or 20 expression by the LAMP (loop mediated isothermal amplification) method. The primers of the invention may be useful for the detecting cytokeratin 18-20 expression as an indicator for the diagnosis of tumour metastasis, particularly prostate cancer and lymphoma. The amplification using the primers is highly efficient and allows very sensitive detection of tumour metastasis. The current sequence is that of the human CK19-related PCR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     human; T-cell associated disease; Vbeta; autoimmune disease; degenerative nervous system disease; graft versus host disease; hypersensitivity disease; infectious disease; neoplastic disease; Addison's disease; atrophic gastritis; degenerative nervous system disease; multiple sclerosis; Alzheimer's disease; hypersensitivity disease; type I hypersensitivity; Goodpasture's syndrome; type IV hypersensitivity; logicity; disease; viral infection; type IV hypersensitivity; laprosy; infectious disease; viral infection; HIV; fungal infection; Candida; parasitic infection; schistosome; filaria; bacterial infection; Mycobacterium; neoplastic disease; lymphoproliferative disease; leukaemia; lymphoma; cancer; brain cancer;
                                                                                                                                                                                                              LAMP nucleic acid amplification primers for detection of cytokeratin expression as indicator in diagnosis of tumour metastasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0.8%; Score 13.4; DB 1; Length 17; 93.3%; Pred. The kit is useful for diagnosing organ transplant rejection and diagnosing and treating T-cell associated diseases graft versus host diseases, degenerative nervous system diseases, and neoplastic diseases. Autoimmune diseases include Addison's diseases and neoplastic diseases. Autoimmune diseases include Addison's diseases arcphic gastritis. Degenerative nervous system diseases include multiple sclerosis and Alzheimer's disease. Hypersensitivity diseases include Type I hypersensitivities such as contact with allergies that lead to declare the diseases. Type II hypersensitivities such as the second to the second to declare the declared the declared
                                                                                                                                                                                            autoimmune, degenerative nervous system and infectious disease, comprises
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Goodpasture's syndrome and Type IV hypersensitivities such as those manifested in leprosy. Infectious diseases include viral infections caused by viruses such as HIV, fungal infections such as those caused by the yeast genus Candida, parasitic infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by Mycobacterium. Neoplastic diseases include lymphoproliferative diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        lymphomas and cancers such as cancer of the brain,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            breast. The present sequence represents a Vbeta gene repeat sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                   The invention relates to an enzymatic nucleic acid molecule that specifically cleaves RNA derived from hepatitis B virus (HBV) and 2.0mprising one or more binding arms, without requiring the presence of a 2.0H group within the molecule for activity. The nucleic acids are useful for treating hepatitis B virus infection, hepatitis, hepatocellular carcinoma, cirrhosis and liver failure, either alone or in combination with other therapies such as lamivudine and interferons. The nucleic acids are useful as diagnostic tools to examine genetic drift and mutations within diseased cells, for detecting the presence of HBV RNA in a cell, for the study of RNA and for down-regulating gene expression of target genes in bacterial, fungal, viral, plant or mammalian cells. This sequence represents an HBV RNA target sequence, used in the scope of the invention. Note: The sequence data for this patent is also available in electronic format from USPTO at sequence. Such as a sequence.
                                                                                                                                               Novel enzymatic nucleic acid molecule such as DNAzymes and inozymes specifically cleaving RNA derived from hepatitis B virus and comprising one or more binding arms, useful for treating hepatitis and cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The invention relates to an enzymatic nucleic acid molecule that specifically cleaves RNA derived from hepatitis B virus (HBV) and comprising one or more binding arms, without requiring the presence of a useful for treating hepatitis B virus infection, hepatitis, hepatocellular carcinoma, cirrhosis and liver failure, either alone or in hepatocellular carcinoma, cirrhosis and liver failure, either alone or in combination with other therapies such as lamivudine and interferons. The nucleic acids are useful as diagnostic tools to examine genetic drift and mutations within diseased cells, for detecting the presence of HBV RNA in a cell, for the study of RNA and for down-regulating gene expression of target genes in bacterial, fungal, viral, plant or mammalian cells. This sequence represents an HBV RNA target sequence, used in the scope of the
                                                                                                                                                                                                                                                                                                       Novel enzymatic nucleic acid molecule such as DNAzymes and inozymes specifically cleaving RNA derived from hepatitis B virus and comprising one or more binding arms, useful for treating hepatitis and cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Note: The sequence data for this patent is also available in

The invention relates to an enzymatic nucleic acid molecule that specifically cleaves RNA derived from hepatitis B virus (HBV) and comprising one or more binding arms, without requiring the presence of a 2'-OH group within the molecule for activity. The nucleic acids are useful for treating hepatitis B virus infection, hepatitis, hepaticis, on the relation with other therapies such as lamivadine and interferons. The nucleic acids are setul as diagnostic tools to examine genetic drift and mutations within diseased cells, for detecting the presence of HBV RNA in a cell, for the study of RNA and for down-regulating gene expression of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           target genes in bacterial, fungal, viral, plant or mammalian cells. This sequence represents an HBV RNA target sequence, used in the scope of the invention. Note: The sequence data for this patent is also available in electronic format from USPTO at seqdata.uspto.gov/sequence.html.
                                                                                                                                                                                                                                  specifically cleaving RNA derived from hepatitis B'virus and comprising
one or more binding arms, useful for treating hepatitis and cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Hepatitis B virus; HBV; ss; enzymatic nucleic acid; RNA cleavage; hepatitis B virus infection; hepatitis; hepatocallular carcinoma; cirrhosis; liver failure; lamivudine; interferon; genetic drift; virucide; hepatotropic; antiinflammatory; cytostatic.

specifically cleaves RNA derived from hepatitis B virus (HBV) and

comprising one or more binding arms, without requiring the presence of a

2 '-OH group within the molecule for activity. The nucleic acids are

useful for treating hepatitis B virus infection, hepatitis,

combination within other therapies such as lamivodine and interferons. The

nucleic acids are useful as diagnostic tools to examine genetic drift and

mutations within diseased cells, for detecting the presence of HBV RNA in

combination within diseased cells, for detecting the presence of HBV RNA in

companies in bacterial, fungal, viral, plant or mammalian cells. This

capers genes in bacterial, fungal, viral, plant or mammalian cells. This

sequence represents an HBV RNA target sequence, used in the scope of the

invention. Note: The sequence data for this patent is also available in

electronic format from USPPTO at sequence.opev/sequence.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                        Novel enzymatic nucleic acid molecule such as DNAzymes and inozymes specifically cleaving RNA derived from hepatitis B virus and comprising one or more binding arms, useful for treating hepatitis and cirrhosis.

                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                       The invention relates to an enzymatic nucleic acid molecule that specifically cleaves RNA derived from hepatitis B virus (HBV) and comprishing one or more binding arms, without requiring the presence of a useful for treating hepatitis B virus infection, hepatitis, hepatocellular carcinoma, cirrhosis and liver failure, either alone or in combination with other therapies such as lamivudine and interferons. The nucleic acids are useful as diagnostic tools to examine genetic drift and mutations within diseased cells, for detecting the presence of HBV RNA in a cell, for the study of RNA and for down-regulating gene expression of target genes in bacterial, fungal, viral, plant or mammalian cells. This sequence represents an HBV RNA target sequence, used in the scope of the invention. Note: The sequence data for this patent is also available in electronic format from USPTO at seqdata.uspto.gov/sequence.html.
                                                                             Novel enzymatic nucleic acid molecule such as DNAzymes and inozymes specifically cleaving RNA derived from hepatitis B virus and comprising one or more binding arms, useful for treating hepatitis and cirrhosis.
                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an enzymatic nucleic acid molecule which specifically cleaves RNA derived from hepatitis C virus (HCV), in which the binding arms of the enzymatic nucleic acid molecule comprises sequences complementary to any of the defined substrate sequences given in the specification. The nucleic acid molecule may be administered for the treatment of HCV infections, especially in combination with type I interferons. The present sequence represents a HCV DNAzyme substrate
                                                                                                                                                                         The invention relates to an enzymatic nucleic acid molecule which specifically cleaves RNA derived from hepatitis C virus (HCV), in which the binding arms of the enzymatic nucleic acid molecule comprises sequences complementary to any of the defined substrate sequences given in the specification. The nucleic acid molecule may be administered for the treatment of HCV infections, especially in combination with type I interferons. The present sequence represents a HCV DNAzyme substrate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            enzymatic nucleic acid, RNA cleavage, hepatitis C virus; HCV; infection; type I interferon; DNAzyme.

Enzymatic nucleic acid molecules which specifically cleave RNA derived from hepatitis C virus (HCV), useful for the treatment of HCV infections, especially in combination with type I interferon therapy. The invention relates to an enzymatic nucleic acid molecule which specifically cleaves RNA derived from hepatitis C virus (HCV), in which the binding arms of the enzymatic nucleic acid molecule comprises sequences complementary to any of the defined substrate sequences given in the specification. The nucleic acid molecule may be administered for the treatment of HCV infections, especially in combination with type I interferons. The present sequence represents a HCV DNAzyme substrate Claim 1; SEQ ID NO 3904; 198pp; English.

ANDOYNEST LEWIST LEWIST LAUGHE SHOUT THE TRADDIT CHOLEBLETOL CETP is a 74 kD glycoprotein that facilitates neutral lipid transfer between plasma lioporoteins. The numbering of the targets refers to the position of the cleavage site in full length CETP. The ribozyme then plasma lioporoteins. The numbering of the targets refers to the binds to 4-6 nucleotides 5', and a variable number 3' of this site. The clooking synthesis and/or expression of the RMNA. By inhibiting CETP, thereby blocking synthesis and/or expression of the MRNA. By inhibiting CETP, the colliminated) thereby preventing the reduction in size density of the high clooking synthesis. The ribozymes can be used to treat conditions continued thereby preventing the reduction in size density of the high increasing HDL levels. The ribozymes can be used to treat conditions associated with abnormal levels of CETP, specifically atherosclerosis, complications of diabetes, transplant, atherectory and angioplastic complications of diabetes, transplant, atherectory and angioplastic createnosis. By inhibiting CETP, the levels of HDL and low density decrease in LDL, and the HDL:LDL ratio are favourably altered (a decrease in LDL levels), and the HDL:LDL ratio are favourably altered (a ribozymes can also be used diagnostically to study genetic drift and materions in diseased cells, and a corresponding increase in HDL levels). The cribozymes can also be used diagnostically to study genetic drift and maintie. neutral lipid transfer; plasma lipoprotein, afherosclerosis, atherectomy, reverse cholesterol transport; high density lipoprotein; therapy; CETP; familial hypercholesterolaemia; dyslipidaemia; hypolphalipoproteinemia; peripheral vascular disease; hyperbetalipoproteinaemia; RCT; inhibitor; angioplastic restenosis; low density lipoprotein; diabetes; HDL; rabbit; New ribozyme(s) for cleaving cholesterol ester transfer protein mRNA - useful for preventing or treating initial development, progression or regression of vascular diseases, esp. familial hypercholesterolaemia. ester transfer protein; mRNA cleavage; AAT50699-T50754 represent target sequences for the rabbit cholesterol Bisgaier C, Rabbit CETP hairpin ribozyme target sequence #588. PCR primers AAV12776-86 are used for PCR, in situ reverse transcription CC PCR (RT-PCR) and RT-PCR. The rearrangement of immunoglobulin (Ig) H genes CC or the rearrangement of T cell receptor (TCR) genes in a clone is called its "clonotypic rearrangements. The primers are used to identify clonotypic rearrangements in haematopoietic cells from a clonotypic rearrangements in haematopoietic cells from a comprises isolating a neoplastic haematological neoplastic disease. A novel comprises isolating a neoplastic haematological cearrangements. This method comprises isolating a neoplastic haemopoietic cell containing a target clonotypic rearrangement and amplifying a specific segment of the target. The amplified product is sequenced to determine if the clonotypic of rearrangement is present. The method is especially used to monitor a patients' response to treatment of haematological cancer (e.g. multiple myeloma, Hodgkin's disease or acute lymphoblastic leukaemia. The method comparations dest to treatment of haematological cancer (e.g. multiple can also be used to test bone marrow samples, including stem cells, intended for autologous transplant. Other applications include detecting clonotypic cells in premalignant and autoimmune states, identifying cell and applications in a malignant clone and

AAV73887-V73911 are PCR primers used in a method for subtyping complex coplymorphic loci in a DNA-containing sample, in which individual alleles polymorphic loci in a DNA-containing sample, in which individual alleles are detected by multiple nucleic acid amplifications that produce consistence is identified from the combination of amplifications that produce amplicons from alleles present in the sample. The method is especially used to subtype the human leuccyte antigen (HLA)-A locus, particularly used to subtype the human leuccyte antigen (HLA)-A locus, particularly to the subtype to detect the A*0201 allele. The method is applied to before therapy, e.g. for subtyping bone marrow transplants, gene therapy vaccines, tumour cell vaccines, with sequence-specific primers to of polymerase chain reaction (PCR) with sequence-specific primers to femplify the most important alleles first (so that only rarer alleles require additional tests) reduces the number of experiments needed for subtyping. To identify an allele, a PCR reaction must occur, i.e. any constitution that the produces the number of experimental error and will not

```
The present invention describes detecting nucleotide triplet repeats in a region of human chromosome 18q disposed between polymorphic markers of region of human chromosome 18q disposed between polymorphic markers of the said between massociated with a mood disorder or related disorder. AAX88542 to AAX88705 represents human chromosome 18q between markers busen in the exemplification of the present invention. YAC clones comprising a portion of the region of human chromosome 18q between markers D18868 and D188579 are used to identify at least one human gene associated with a mood disorder or related disorder. The mood disorder or related disorder, is chosen from the Disgnostic and Statistical Manual of Mental Disorders, version 4 (DSM-IV) taxonomy. This includes mood disorders (296.XX, 300.4, 311, 301, 13, 295.70), schizophrenia and related disorders (295, 297.1, adjustment disorders (309.XX) and personality disorders (295, 297.1, cadjustment disorders (309.XX) and personality disorders (consenting the mood disorder or related disorder can be used to detect pathological mutations or genetic variations in patients. The methods, probbs and antibodies can be used to detect and related disorder or related disorder or related disorder. The nucleic acids and proteins of the human gene can be used to treat mood disorders and related disorders.
identification; trinucleotide repeat expansion; schizophrenia; anxiety disorder; adjustment disorder; personality disorder; nucleotide triplet repeat; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Detecting nucleotide triplet repeats in human chromosome 18q
                                                                                                                                                                                                                                                                                                                       (VLAA-) VLAAMS INTERUNIVERSITAIR INST BIOTECHNOG.

-13, such as cancer

This sequence represents an antisense inhibitor of the invention, and inhibits the expression of the human G-alpha-13 protein. The antisense compounds of the invention are of 8 to 30 nucleobases in length, that inhibits the expression of the human G-alpha-13. The antisense compound is useful for treating an animal, particularly humans, having or being prone to a disease or condition associated with the expression of G-alpha

invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AASOS79 to AAZ7440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from
                                                                                                                                                                                                        0
Primers AAX79310-X79315 were used to PCR amplify the human serotonin receptor splice variants 5-HT-4(c) (AAX79305) and 5-HT-4(d) (AAX79307). 5 -HT4(c) and 5-HT4(d) receptor polypeptides can be used to screen for substances, especially ligands, useful in the treatment of CNS disorders associated with abnormal 5-HT4(c) receptor expression or gastrointestinal disorders associated with abnormal 5-HT4(d) receptor expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel biallelic markers used to construct a high density disequilibrium

perguences AAMAJOLUS - AAMAGONY44 represent rick pilmers, suigle undirectioned primers, and the sequences of regions flanking sites of single nucleotide polymorphisms SNPs. The present invention includes kits for determining the presence or absence of a SNP, using the cligonucleotides of the invention. The PCR primers are used to amplify a SNP flanking sequence, the SNPE primer is used as a genotyping primer. The oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer sextension. The cligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer sextension. The cligonucleotides are useful for denermining the presence, absence or cliquity of a SNP and for genotyping nucleic acid samples, for e.g. to assess by association analysis the genotype of an individual or group of clidividuals, having a pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include diseases e.g. agammaglobulinaemia, diabetes instpidus, Lesch-Nyhan syndrome, muscular of vertophy, familial hypercholesterolaemia, polycystic kidney disease, of experced and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial diseases, including, rheumatoid arthritis, multiple sclerosis, consequence, the microcapter of also useful in forensic investigations and inferding and also useful in forensic investigations and encourted and accounted are also proved and accounted accounted and accounted accounted and accounted accounted and accounted and accounted accounted accoun
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      paternity analysis. The present sequence represents a PCR primer specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide

New phosphinoamidite carboxylate derivatives useful in synthesis of oligonuclectides and for treating e.g. cancer and HIV.

Example 38; Page 68; 104pp; English.

The invention relates to new phosphinoamidite carboxylate derivatives

(I). (I) are used for the synthesis of oligonucleotides. (I) are also
used as antivital or anticancer agents for the treatment of HTLV-I, HTLVII, human immunodeficiency viruses, HTLV-III (AIDS virus), influenza type
A, B and C, mumps, measles, rhinovirus, dengue, rubella, rabies,
hepatitis virus A, encephalitis virus, herpes viruses (e.g. herpes
simplex virus A, encephalitis virus, human herpes
simplex virus, human cytomegalovirus, human herpes virus 6, human herpes
virus 7 and human herpes virus 8), vaccinia, papilloma virus, hepatitis
virus B, leukaemias (e.g. acute lymphoblastic chronic lymphocytic, acute
myloblastic and chronic mylocytic leukemias), carcinoma (e.g. cervix,
oesophagus, stomach, small intestines, colon and lungs), sarcomas (e.g.
eesteroma, osteosarcoma, lepoma, liposarcoma, hemangioma and
hemangiosarcoma), melanomas (e.g. amelanotic and melanotic), 

sequence represents a nuclease resistant oligonucleotide of the invention carcinosarcoma, lymphoid tissue type, follicular reticulum, cell sarcoma and Hodgkins disease. The synthesised oligonucleotide has reduced internucleotide charge and improved nuclease resistance. Synthesis of oligonucleotides is effected in high yielding coupling reactions at the phosphorous group as well as high yielding reactions at the carboxylate group, with the phosphorous-carboxylate group left intact. Arraying genome clones.

Claim 4; Page 41; 528pp; Japanese.

The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in method comprises: (a) clones of the genomic libraries contained in each of the multiwell plates numbered for discrimination are mixed in each of the multiwell plates to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant explicitly broduct to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the maximum in the specified discrimination Nos. succeed to plates; (e) the clones in the multiwell plates of the specified discrimination Nos. are mixed respectively in each wells of longitudinal corresultant cultures are amplified by using the above primer; (g) signals are detected from the amplified by using the above primer; (g) signals are detected from the amplified products; (h) the clones in the multiwell plates are specified from the detected result; and (i) the clones are concernated as the positions on the chromosome and arrayed. The microarray is useful for gene analysis. ABL42957 to ABL45323 to ABL45334 to Relationally creptered from the man chromosome 21q22.1, which are specifically claimed for use in the present invention

The invention relates to a method of sequential consensus region-directed amplification for sorting a mixture of DNAs into 2 or more subsets or distinguishing gene expression patterns in 2 samples. The methods, kits and oligomucleotides are useful for sorting a mixture of DNAs into 2 or more subsets or distinguishing gene expression patterns in 2 samples e.g. for disease diagnosis and gene analysis. The present sequence is a PCR primer designed to bind to human matrix metalloproteinase (MMP) propeptide region (PPR). This primer is used to illustrate the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequential consensus region-directed amplification for sorting mixture of DNAs into 2 or more subsets or distinguishing gene expression patterns in 2 samples, useful for disease diagnosis and gene analysis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Differential display method; leucine-rich motif; transmembrane protein; secreted protein; secreted protein signal peptide; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0;
                                                                           0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention provides antisense sequences directed against the VRI mRNA. These can be used in the treatment of pain, especially chronic, heat-induced or inflammatory pain, tactile allodynia, urinary incontinence, neurogenic bladder symptoms, prunitis, tumours and inflammation (particularly where associated with the VRI vanilloid receptor such as asthma). They are also useful for identifying analgesic agents. The present sequence is a VRI antisense sequence identified in

```

```
The invention relates to a differential display comprising contacting conds with a first primer that hybridises to an oligonucleic sequence coding for a leucine-rich motif, and with a second oligonucleotide primer to form a cDNA-hybrid molecule. The method comprises obtaining mRNA from at least 2 samples, synthesising cDNA from the RNA of each sample, contacting the cDNA with a first primer that hybridises to an oligonucleic sequence coding for a leucine-rich motif, and with a second oligonucleic sequence coding for a leucine-rich motif, and with a second oligonucleotide primer to form cDNA-hybrid molecules, amplified products from each sample to identify distinctive amplified products from each sample to identify distinctive amplified products coding for at least one secreted or transmembrane protein. The method is useful for discovering novel secreted and/or transmembrane comparant for cell processes and play an important cole in determining its phenotype, and which act as mediators for the transfer of signals from external environment into the cell itself, thus modulating gene expression. Sequences ABX03792-ABX03869 represent DNA coding secreted protein signal peptide sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Differential display method for identifying secreted or transmembrane protein, comprises contacting a DNA with a first primer that hybridizes to a sequence coding for a leucine-rich motif and with a second oligonucleotide primer.
                                                                                                  (UYRA-) UNIV RAMOT APPLIED RES & IND DEV LID.

and/or germination, development, maturation, and modifying a plant developmental process. They are also useful for modifying plant tolerance and adaptation to stresses and adverse environmental stimuli. The ALLO IS ALSO USED IN GENE THERAPY. The present sequence is a primer used for sequencing Lolium perenne LpPKABAb CDNA The invention relates to nucleic acid encoding abscisic acid-inducible and stress responsive proteins (ASR and A22), stress-inducible cysteine proteases (CYS), late embryogenesis abundant proteins (LEA), deflydrins (DHN) and abscisic acid-induced protein kinases (PKBA). The invention also relates to a method for modification of plant and seed development and plant responses to a stresses and stimuli. The invention is useful as molecular genetic markers. The method is useful for modifying plant response to an environmental stimulus, modifying plant tolerance to abolitic, osmotic and/or temperature stresses, madifying seed dormancy and the second commence of t

New G-protein coupled receptor array comprising individual polynucleotide spots stably associated with a surface and a solid support useful for

```
CC human delta-opioid receptor (hDDR). This opioid receptor belongs to the chuman delta-opioid receptor (hDDR). This opioid receptor belongs to the G protein coupled receptor (GPCR) family. The amplified fragment was used composition coupled receptor (GPCR) family. The supplication describes a GPCR array of the invention. The specification describes a GPCR array comprising a multiplicity of individual polynucleotide spots comprises a GPCR polynucleotide spots comprises a GPCR polynucleotide family member, consisting a non-conserved region of a GPCR polynucleotide family member, consisting a non-conserved region of a GPCR polynucleotide family member, consisting a non-conserved region of a GPCR polynucleotide family member. The GPCR array is useful for determining to polynucleotide family member. The GPCR array is useful for determining the pathogenesis of different ion-related conditions or diseases in character adiabetes, AIDS, allergies, dermatitis, psoriasis, consisting a disease, Parkinson's disease, arthritis, depression, lupus, hearthism and a parasitic infections, transplant rejection, lupus,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ..

            polymorleocide comprising single nucleotide polymorphisms predicting cardiovascular disease. The polymucleotides are useful for assessing predisposition or susceptibility to a cardiovascular disease, earlier atherosclerosis, ischemia/reperfusion, hypertension, restenosis, arterial inflammation, myocardial infarction, and stroke. These may also be used to predict personal medication schemes omitting adverse drug reactions, or as probes for detecting genetic polymorphisms and as templates for the recombinant production of normal or variant peptides/polypeptides encoded by the genes. This sequence corresponds to a PCR primer to amplify one of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               reporter construct; reporter element; effective analysis; high-throughput; microtitre well format; light emission; primary cell screening; low level mRNA expression; ss; human; antisense; EST; expressed sequence tag.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a reporter construct (RC) comprises a reporter element (RE) and a target nucleic acid, inserted 3' to RE, in the untranslated region. RC are used to identify, particularly in screening assays, oligo- or poly-nucleotides that modulate expression of a target sequence, particularly antisense sequences and ribozymes, potentially useful as pharmaceuticals. RC provide (a) effective analysis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Reporter construct, useful for identifying potential therapeutic oligoor poly-nuclectides, comprises target nucleic acid inserted 3' to a reporter element.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Weiler J;

biological activity of many test sequences against specific targets; (b) monitoring of mRNA levels without the cost and extensive pipetting required in reverse transcription PCR; and (c) use of high-throughput, microtitre well formats for screening, with the reaction (light emission) well (no need for a set of probes as in e.g. the Tagman assay). The method is especially useful for screening primary cells (or other cells that are difficult to obtain) or where target mRNA is expressed at very present invention.
                                                                                                                                                                                                                                                                                                                                                                         Human, alpha 64; alpha 6B; integrin; cell surface receptor; adhesion; extracellular matrix; cytoskeleton; heterodimer; laminin receptor; alpha 3A; polymerase chain reaction; PCR; amplify; hamster; ss.

Length 18; 1; Indels Integrin alpha sub-unit cytoplasmic domain polypeptide(s) - used for prodn. of antibodies and in detection of integrin sub-units in body

Disclosure; Page 95; 115pp; English.

The sequences given in AAQ31193-98 are primers which were used to amplify the coding sequences for the human alpha 6A and the hamster alpha 3A integrin subunities. Integrins are a family of cell surface receptors which serve cellular adhesion functions. These receptors form a link between the extracellular matrix and the cytoskeleton through their binding to comprised of an alpha and a beta subunit. Each alpha subunit tends to associate with only one type of beta subunit but there are several exceptions to this rule. The 6A and 6B integrin subunits correspond to the laminin receptor. The cytoplasmic domain of the 6A and 6B integrins differs from previously isolated alpha 6 integrins. (Updated on 25-MAR-2003 to correct PN field.)

It was used with primer P4' (see AAW30805) to generate a 442 bp nucleic acid fragment that lies immediately 5' to the polymorphic AfIIII cut site in Fragment that lies immediately 5' to the polymorphic AfIIII cut site in Germline polymorphism at position 729 in the prohibitin gene 3'UTR (see also AAV30797) is a susceptibility marker for breast cancer. Homozygous CT/T at this position carries the greatest lifetime risk, heterozygous C/T at this position carries the greatest lifetime risk, heterozygous C/T bubstitution of a T for C at position 729 results in loss of cleavability by AfIIII. RFLP analysis allows the risk of heredicary breast cancer to be determined in both women and men. (Updated on 25-MAR-2003 to correct
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     .;

The invention provides new Staphylococcus aureus polypeptides (AAV03781-94) and the genes (AAX31851-864) encoding them. Host cells containing vectors comprising the nucleic acid sequences are used for the crecombinant expression of the proteins. The polypeptides can be used to screen for modulators for use in antibacterial therapy. The polypeptides, their antagonists and agonists are used to prevent or treat diseases caused by S. aureus such as thyroiditis, lung abscesses, infective, carditis, secretory diarrhoea, cerebral abscesses, conjunctivitis, toxic shock syndrome folliculitis and septic arthritis. Screening for the consemplation of the polypeptides may be used to diagnose, predict the susceptibility to, or stage the progress of these S. aureus diseases and diseases caused by Helicobacter pylori such as gastric ulcers and gastric adenocarcinoma. There is not much information known about the essential genes expressed by S. aureus during infection but these new polypeptides can tabacterial compounds specific for those essential compounds specific for those essential genes and this addition, these polypeptides can be used to effectively diagnose and the creat infections and diseases caused by S. aureus without the risk of development of antibiotic resistance. Sequences AAX1865.884 represent proprietides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New essential polypeptides from Staphylococcus aureus useful for treating diseases such as infective endocarditis and toxic shock syndrome.
                                                                                                                                                                                         Staphylococcus aureus polypeptide; thyroiditis; infective carditis; lung abscess; secretory diarrhoea; cerebral abscess; conjunctivitis; toxic shock syndrome; folliculitis; septic arthritis; antibacterial; H. pylori infection; gastric ulcer; adenocarcinoma; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0.8%; Score 13.4; DB 1; Length 19; 33.3%; Pred.                                                                                                                                                                                                                                                                                          comprising analysing barley genomic DNA to determine which allele(s) of the locus, designated eph on the short arm of homologous Triticeae group 1 chromosome (barley chromosome 5) is/are present. The methods and primers are useful for identifying microsatellites Bmac96 and Bmac213, which are useful for determining fermentability and/or epi-heterodendrin production in cereals, especially barley. Current methods for determining fermentability are difficult to apply within barley breeding programs.
                                               This sequence represents a PCR primer for a barley chromosome 7 microsatellite marker, and can be used in the method of the invention. The method is for screening cereal for fermentability, comprising analysing cereal genomic DNA to determine which allele(s) of a gene/gene complex affecting fermentability at a locus close to the centromere on homologous Triticeae group 5 chromosome (barley chromosome 7) is/are present. The invention also relates to a method for screening cereal for ethyl carbamate production on wort fermentation and distillation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ..

The specification describes a method for determining the identity of nucleotide 729 of the prohibitin gene as a means of determining the risk of cancer than breast cancer. The method comprises determining the base identity of a portion of genomic DNA from a patient cell, where the genomic DNA comprises an untranslated region (UTR) of a prohibitin gene, the portion corresponding to position 729 of the sequence given in AAX59834, and correlating the base identity with germline polymorphisms in the 3' UTR is used as a susceptibility marker for cancer context than breast cancer. The method determines the lifetime probability of an individual developing cancer based on an allelic variation found in the 3'UTR of the prohibitin gene. This assay could be used in genetic counselling and cancer prognosis, prediction of disease-free intervals, long-term survivorship, and determination of therapy for both men and women. PCR primers AAX59837-38 were used to amplify a fragment of the
                                                                                                                                                                                                                                                                                                                    New diagnostic assay for cancer susceptibility using nucleotide identification of the prohibitin gene.

cdk8 ribozyme binding site #13 AAA83293 standard; DNA; 19 04-DEC-2000 (first entry)

Ribozyme, hairpin, hammerhead, gene therapy, vasotropic, restenosis, ss.

designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1. Representative examples of ribozyme recognition sites are given in AAA83415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in cleaves New hairpin and hammerhead ribozyme for inhibiting restenosis, cleave RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1, PCNA and Cyclin B1. Gaps Targeted chromosomal genomic alteration expression vector primer #7. present invention relates to a hairpin or hammerhead ribozyme .. 0 0.8%; Score 13.4; DB 1; Length 19; 93.3%; Pred.                                                                                                                                                                                                         The present invention provides single-stranded oligonucleotides which can be used for the targeted alteration of genomic sequences, where the oligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, retinoblastoma, BRCA1, BRCA2, CFTR, cyclin-dependent kinase inhibitor 2A (CDRV2A), APC, Factor VI. Factor IX, haemoglobin alpha locus apolipoprotein E (APOE), IDL receptor (IDIR), UDP-glucuronsyltransferase (UGTI), amyloid precursor protein (APC), presenilin-1 (PSEN1) and presenilin-2 (PSEN2). These can be used in the gene therapy of diseases such as cancer, adenosine deaminase deficiency, cystic fibrosis, haemophilia, hypercholesterolaemia, thalassemia, sickle cell ansemia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Single nucleotide polymorphism; SNP; single nucleotide primer extension; SNPE; genotyping; agammaglobulinaemia; diabetes insipidus; cancer; lesch-Nyhan syndrome; muscular dystrophy; familial hypercholesterolaemia; polycystic kidney disease; osteogenesis imperfecta; autoimmune disease; acute intermittent porphyria; rheumatoid arthritis; multiple sclerosis; inflammation; forensic investigation; paternity analysis; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Alzheimer's disease, melanoma, adenomatous polyposis of the colon and various syndromes. The present sequence is a PCR primer described in the exemplification of the invention
                                                   oligonucleotide for targeted alterations of genetic sequences and for treating cystic fibrosis, comprises at least one mismatch and chemical modification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ò

Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases.

Example 1; Page 135; 408pp; English.

The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (I) which cleaves RNA encoding a cytckine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (I). (I) can have antipsoriatic, ophthalmological, cytostatic, antiseborrheic, antidiabetic, antisickling, ophthalmological, vulnerary, keratolytic and virucide activities, and in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermaticis, actinic keratosis, also be used for treating proliferative eye diseases such as diabetic retinopathy, virreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing carring such as keloid, adhesion and hypertrophic or hypertrophic burn scar. AAHS7577 to AAH62099 eperseent sequences used in the exemplification of the present invention

```
The invention relates to an oligonucleotide for targeted alteration of a genetic sequence, which comprises a single-stranded oligonucleotide adving a DNA domain. The DNA domain has at least one mismatch with respect to the genetic sequence to be altered and further comprises consist to the genetic sequence to be altered and further comprises consist of o-methyl modification, an LNA modification, two or more phosphorothioate linkages on a terminus, or a combination of any two or more of these modifications. The oligonucleotides are useful for directing repair or alteration of plant genetic information. The oligonucleotides are particularly useful for creating plants with desired phonotypes, e.g. environmental or abjoic stress tolerance, improved nutritional value (e.g. altering amino acid content of plants or conferring amino acid over production), herbicide resistance (e.g. Glyphosate resistance, imidazolinone and sulphonylurea herbicide resistance, porphyric herbicide resistance or triazine resistance, cessistance, modified oil production, modified starch production (e.g. increased starch or production of waxy starch), altered floral content (e.g. reduced palmitate, increased stearate or reduced linolenic acid). The oligonucleotides are also useful for producing albino mutants for the analysis of phychosate are also useful for producing albino mutants for producting albino mutants for producting albino mutants for manalysis of phychosate manalysis of phychosate manalysis of phychosate manalysis of phychosate medicines medicines manalysis of phychosate manalysis of phychosate medicines medicines manalysis of phychosate medicines medicines medicines medicines medicines medicines.
                                                                                                                                                                                                                                                               New oligonucleotides with modified nuclease-resistant termini, useful for creating plants with desired phenotypes, e.g. stress tolerance, improved nutritional value, herbicide or disease resistance, or modified oil
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        analysis of photosynthetic processes. This sequence represents a genome altering oligonuclectide of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes a novel murine alphabeta T-cell receptor (TCR) that mediates a hdm2 protein-specific T cell response, a fusion protein (FP) that includes the TCR and nucleic acid encoding it, alpha or betachains of a TCR that include the antigen-recognizing sequence (ARS) of an antibody specific for aa 81-88 of hdm2 (or its complex with HLA-A2-
                                                                                                                                                                                                                                                                                          0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New polypeptide of a murine alpha/beta T-cell receptor, useful for treating tumors and leukemia, induces specific lysis or apotosis of cells
                                                                                                                                                  The present invention relates to murine alphabeta T-cell receptors (TCR) which mediate a p53 protein-specific T cell response. The proteins and their coding sequences are useful for treatment, prevention and diagnosis of p53-associated diseases, particularly tumours and leukemia, including use for passive or active immunisation, and also to screen for therapeutic agents. The present sequence is a PCR primer used to identify

medicament for treating or preventing neurodegenerative of a medicament for treating or preventing neurodegenerative diseases (e.g. Alzheimer's disease, Parkinson's disease, or Huntington's diseases), concurodical disorders (e.g. anxiety, schizophrenia, manic depression or mental retardation), cardiovascular disease (e.g. acute heart failure, angina pectoris or myocardial infarction), muscular diseases and disorders, retinal diseases (including those involving photoreception, deafness and keratinisation disorders, inflammatory and immune diseases, bacterial, fungal, protozoal and viral infections, and reproductive system disorders. The proteins of the invention may be used to screen system disorders. The proteins of the invention may be used to screen cugs or compounds that modulate the NOVX protein activity or expression, as well as to treat disorders characterised by insufficient or excessive production of NOVX protein or protein forms that have decreased or as well as to be a dispart or not or protein forms that have decreased or aberrant activity compared to NOVX wild type protein, such as diabetes, obesity, metabolic disturbances associated with obesity, anorexia and wathing disorders associated with chronic diseases and various cancers. sequences of the invention may be used in chromosome mapping, identifying an individual from minute biological samples (tissue typing), and in forensic identification of a biological sample. The present nucleic acid sequence represents a PCR primer that was used in the methods of the Gaps The present invention relates to new NOVX polypeptides. The poly polynucleotides and antibodies are useful in the manufacture of . 0 0.8%; Score 13.4; DB 1; Length 19; 93.3%; Pred.                                                                                                                            environmental stress comprises constructing an expression vector containing a nucleotide sequence for controlling over or under expression of ABF and an ABF gene in the sense or anti-sense direction, introducing the expression vector into a plant cell using Agrobacterium-mediated raranformation, ballistic transformation or other transformation, and selecting and maintaining transformed cell capable of expressing the recombinant ABF. The present sequence represents a reverse transcriptase (RT) PCR primer which is used in the exemplification of the present
The present invention describes transgenic plants with enhanced stress tolerance is composed of recombinant DNA segments encoding abscisic acid responsive element-binding transcription factors (ABFS) and expresses an effective amount of ABFs sufficient to increase tolerance to stress, where the ABF is ABF3 and/or ABF4. The present invention also describes a method for increasing tolerance against decreased water utility and other

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SXXX
                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to new isolated NoVX polypeptides, the genes encoding them or sequences having at least 95% identity to the amino acid cor nucleotide sequences. The NoVX polypeptide is useful as a therapeutic, particularly in the manufacture of a medicament for treating a syndrome associated with a human disease, which includes a pathology associated with novX polypeptide. The NoVX polypeptide is particularly useful for treating, preventing or alleviating pathology associated with NoVX tolypeptide are especially useful for treating, preventing or alleviating pathology associated with NoVX tolypeptide are especially useful for treating or preventing e.g. diabetes, obesity, cancers (e.g. lymphoma, uterus cancer or prostate cancer), dyslipidemias, anorexia, wasting disorders, Alzheimer's disease, parkinson's disorder, cachexia, cardiomyopathy, AIDS, asthma, Crohn's disease, multiple sclerosis, hypertension, atherosclerosis, hemophilis, graft-versus-host disease or Albright hereditary osteodystrophy. The DNA encoding the protein is useful in gene therapy for treating the above conditions. These are also useful in developing powerful assay system for applications. These are persented a forward PCR primer used to applications. This sequence represents a forward PCR primer used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ÷

the present invention usecimes a short interfitting muteric acts that downrequlates expression of a mitogen-activated profein kinase conditions by RNA interference. Also described: (1) a method for modulating expression of MAPK genes in cells, tissue explants or coganisms by introduction of MAPK genes in cells, tissue explants or corganisms by introduction of SiNA; (2) kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA; and (4) conjugates sinA and cells containing these vectors. MAPK siNAs care express siNA and cells containing these vectors. MAPK siNAs care expressive, antibacterial, antirheumatic, antischmatic, antischmatic, antischmatic, antischmatic, antischmatic, antischmatic, antischmatic, antischmatic, siNAs can be used to modulate the expression of MAPK genes; in cells, siNAs can be used to modulate the expression of MAPK genes; in cells, tissue explants or organisms, e.g. for treating obesity; diabetes types I complete shock, rheumatoid arthritis, psoriasis and inflammatory bowel disease, they can also be used for drug screening; diagnosis; target disease). They can also be used for drug screening; diagnosis; target disease). They can also be used for drug screening; diagnosis; target diseatification and validation; genetic engineering; pharmacogenomics; cudontification and gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence represents a MAPK sinA which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       present invention describes a short interfering nucleic acid (siNA)
cytostatic; anorectic; antidiabetic; antinflammatory; antiasthmatic; immunosuppressive; antibacterial; antirheumatic; antiarthritic; antipsoriatic; gastrointestinal; obesity; diabetes; tumour; inflammatory disease; asthma; septic shock; rheumatoid arthritis; psoriasis; inflammatory bowel disease; drug screening; genetic engineering; pharmacogenomic; gene mapping; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The present invention describes a short interfering nucleic acid (siNA) that downregulates expression of a mitogen-activated protein kinase (MAPK) genes by RNA interference. Also described: (1) a method for modulating expression of MAPK genes in cells, tissue explants or crganisms by introduction of siNA; (2) kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA; and (4) celivery of siNA; (3) conjugates and/or complexes of siNA; and (4) certors that express siNA and cells containing these vectors. MAPK siNAs have cytostatic, americally antinflammatory.

Cantiarthatic, immunosuppressive, antibacterial, antinheumatic, antiarthatic, antipsoriatic and gastrointestinal activities. The MAPK siNAs can be used to modulate the expression of MAPK genes, in cells, tissue explants or organisms, e.g. for treating obesity; diabetes types I and II; a wide range of tumours, and inflammatory diseases (asthma, complexed shock, rheumatoid arthritis, psoriasis and inflammatory bowel clantification and validation; genetic engineering; pharmacogenomics; studying gene function and gene moderned represents a MAPK siNA which is used in the avenum; if it is not the avenum; if it is not the avenum; if it is used in the avenum; if it is used in the avenum; is used in the avenum; is used in the avenum; if it is a sequence represents a MAPK siNA which is used

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the human Myc or Myb genes by RNA interference. The siNAs may or may not comprise sense and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siNAN), double-stranded RNA, micro-RNA (miRNA) and short can contain deoxyribonucleotides, and can be chemically synthesised, candyor complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the Myc or Myb genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be compacted to and polycystic kidney disease. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and carpened sina, genetic engineering, pharmacogenomics, studying gene condition, and gene mapping (e.g., of single nucleotide polymorphisms). double-stranded siNA.

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the human Myc or Myb genes by RNA downregulate expression of the human Myc or Myb genes by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense or regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised.

Can contain deoxyribonucleotides, and can be chemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised.

Can complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the Myc or Myb genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be consed for treating cancers and other proliferative diseases, such as crestenosis and polycystic kidney disease. The siNAs are also useful for cup screening, diagnosis, therapeutic target identification and cyalidation, genetic engineering, pharmacogenomics, studying gene

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention relates to a novel composition for human integrin alpha-6-beta-4 production promotion which contains extracts of a plant selected from Hedera helix (English ivy), Enchinacea, pumpkin, Taraxacum officinale (dandillon) or angelica. The invention is useful as cosmetics such as skin lotion, cream, ointment, foundation, hand cream and hair cosmetics lar preventing ageing of skin. The composition promotes adhesion of laminin, which is a structural component of the outer skin basement membrane, and outer skin basal cells. The compositions improve the wrinkle, dullness and sag of skin as well as maintaining youthful skin.
                                                                                                                                                                                                                                                                                                              integrin alpha-6-beta-4 production; plant extract; Hedera helix; Bapilse 1 vy; Echinacea; pumpkin; Taraxacum officinale; dandilion; angelica; cosmetic; skin lotion; cream; ointment; foundation; hand cream; hair cosmetic; skin ageing; laminin adhesion; outer skin basement membrane; outer skin basement membrane; outer skin basement membrane; outer skin base skin sag; youthful skin; PCR; primer; ss; human; RT-PCR; reverse transcription PCR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   in cosmetics,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a novel double-stranded short interfering nucleic acid (siNA) that downregulates expression of the breakpoint cluster region-vabl Abelson murine leukaemia viral oncogene homologue 1 (BCR-ABL) gene. The siRNA of the invention demonstrates cytostatic activity and may be useful for modulating expression of the BCR-ABL gene, as well as for treating leukaemia or lymphoma and in diagnosis, drug screening, target identification and validation, genetic engineering, gene function studies and gene mapping. The current sequence is that of the human ABL1-targeted siRNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New double-stranded interfering nucleic acid, useful e.g. for treatment and diagnosis of leukemia and lymphoma, downregulates the breakpoint cluster region-Abelson (BCR-ABL) gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0.8%; Score 13.4; DB 1; Length 19; 66.7%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a novel double-stranded short interfering nucleic acid (siNA) that downregulates expression of the breakpoint cluster region-v-abl Abelson murina leukaemia viral oncogene homologue 1 (BCR-ABL) gene. The siRNA of the invention demonstrates cytostatic activity and may be useful for modulating expression of the BCR-ABL gene, as well as for treating leukaemia or lymphoma and in diagnosis, drug screening, target identification and validation, genetic engineering, gene function studies and gene mapping. The current sequence is that of the human ABL1-targeted siRNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New double-stranded interfering nucleic acid, useful e.g. for treatment and diagnosis of leukemia and lymphoma, downregulates the breakpoint cluster region-Abelson (BCR-ABL) gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        short interfering nucleic acid, siNA, breakpoint cluster region, v-abl Abelson murine leukaemia viral oncogene homologue 1, BCR-ABL, cytostatic, leukaemia, lymphoma, human, ss. siRNA, ABL1.

of skin ageing. The composition comprises a component which promotes the production of laminin-5 and the integrins alpha-6 and beta-4. The active production of laminin-5 and the integrins alpha-6 and beta-4. The active component used in the composition is preferably an extract from the plants Euphoria longan, Strobilanthes cusia, Polygonatum falcatum, Polygonatum sibiricum, ivy (Hedera helix), Echinacea, pumpkin (Cucurbita pepo), dandelion (Taraxacum officinale), and/or angelica (Angelica archangelica); rice bran oil; or phenyl propanoides or its salt. The composition prevents the ageing of skin by activating skin basal membrane composition also prevents wrinkle formation, staining and skin cuplessing oil skin by activating skin basal and skin dallness, and helps to maintain the skin in a healthy condition. Sequences ADF77916-ADF77911 represent reverse transcription-PCR (RT-PCR) primers used in an example of the invention to determine the effect of various plant extracts on integrin alpha-6 and integrin beta-4 gene expression in human keratinocytes, using gloyeraldehyde-3-phosphate chrospinate expression as a control.
                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a composition for the prevention and improvement
                                                                                                                                                                                                                                                     Composition for preventing and improving ageing of skin, comprises component that promotes laminin and integrin production.
                                                                                                                                                                                                                                                                                                                                 Example; SEQ ID NO 1; 17pp; Japanese.

```
The invention relates to short interfering nucleic acids (siNA) which downregulate expression of one or more human epidermal growth factor receptor (ESTR) genes (including HER1, HER2 and HER3 and HER4) by RNA interference. The siNAs may or may not comprise ribonuclectides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonuclectide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short interfering RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonuclectides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates canded to modulate expression of EGFR genes in cells, tissue explants or or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants or contain and vector or enzymatically express and transplants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants or contain and proving the treatment of a variety of conditions. They may be used for modulate the treatment of a variety of conditions. They may be used for modulate the contain the contain and contain a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 treating a wide range of cancers such as breast and ovarian cancer. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the lower strand of a human HER1 (EGFR)-targeted double-stranded siNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  downregulates expression of the epidermal growth

Human HER1 (EGFR) transcript target sequence/siNA upper strand, SEQ:741.

20-MAY-2004 (first entry)

RNA interference; short interfering nucleic acid; siNA; short interfering RNA; siRNA; double-stranded RNA; micro-RNA; miRNA; short hairpin RNA; shRNA; expression modulation; gene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; cancer; exptostatic; human; oncogene; epidermal growth factor receptor; EGFR; HER1; c-erb-B-1; target sequence; ss.

```
The invention relates to short interfering nucleic acids (siNA) which downregulate expression of one or more human epidermal growth factor receptor (EGFR) genes (including HERA! HER2 and HERA) by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and matisense cregions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short an antisense oligonucleotides, and can be chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised, can (expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA, conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of EGFR genes in cells, tissue explants or cyganisms (e.g., by ex vivo gene therapy), or in grafts and transplants of the treating a wide range of cancers such as breast and ovarian cancer. The siNAs are also useful for drug screening, diagnosis, therapoutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymotyphisms). The present sequence represents the lower strand of a polymotyphisms).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New short interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer, downregulates expression of the epidermal growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                Beigelman L, Fosnaugh K, Jamison S;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0.8%; Score 13.4; DB 1; Length 19; 93.3%; Pred. ```
The invention relates to short interfering nucleic acids (sinA) which downregulate expression of one or more human epidermal growth factor receptor (ESTR) genes (including HERI, HERZ HERS and HERA) by RNA interference. The siNAs may or may not comprise ribonuclectides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonuclectide and an antisense oligonuclectide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short interfering RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonuclectides, and can be chemically synthesised, can contain deoxyribonuclectides, and can be chemically synthesised, can contain deoxyribonuclectides, and can be unmodified or chemically southesised.

CC and/or complexes of siNA, and vectors that express siNA. The siNAs are used to modulate expression of EGFR genes in cells, tissue explants or organisms (e.g., by ex vivo gene Herapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treatment of a variety of conditions. They may be used for treatment and explant or since such as breast and ovarian cancer. The sinAs are also useful for drug screening, diagnosis, therapeutic target condition, genetic engineering, pharmacogenomics, identification and validation, genetic engineering, pharmacogenomics, identification and validation, genetic engineering, pharmacogenomics, identification and validation, genetic engineering, apprentices.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the upper strand of a human HER1 (EGFR)-targeted double-stranded sina, which is identical to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a short interfering nucleic acid (siNA) that down regulates expression of at least one cyclin gene by RNA interference. siNA are used to modulate expression of cyclin genes, in cells, tissue explants or organisms, e.g. for treating a wide range of cancers and other cell-proliferation disorders such as restenosis, but also for drug screening, diagnosis, target identification and validation, genetic engineering, pharmacogenomics, studying gene function and gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence
organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating a wide range of cancers such as breast and ovarian cancer. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the upper strand of a human HER2 (EGFR2)-targeted double-stranded siNA, which is identical to the HER2 transcript target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         short interfering nucleic acid, siNA, cyclin, Cytostatic, Vasotropic, cancer, cell-proliferation disorder; restenosis, drug screening, genetic engineering, pharmacogenomics, gene mapping,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a short interfering nucleic acid (siNA) that down regulates expression of at least one cyclin gene by RNA cells, tissue explants to modulate expression of cyclin genes, in cells, tissue explants or organisms, e.g. for treating a wide range of cancers and other cell-proliferation disorders such as restenosis, but also for drug screening, diagnosis, target identification and validation; genetic engineering, pharmacogenomics, studying gene function and gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence represents the upper strand of cyclin D1 targeted double stranded siNA which is identical to the cyclin D1 transcript target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New short interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer and restenosis, down regulates expression of at least
represents the lower strand of cyclin D1 targeted double stranded siNA

The present invention relates to a short interfering nucleic acid (siNA) that down regulates expression of at least one cyclin gene by RNA interference. SiNA are used to modulate expression of Cyclin genes, in cells, tissue explants or organisms, e.g. for treating a wide range of cancers and other cell-proliferation disorders such as restenosis, but also for drug screening, diagnosis, target identification and validation, genetic engineering, pharmacogenomics, studying gene function and gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence represents the lower strand of cyclin D1 targeted double stranded siNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New short interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer and restenosis, down regulates expression of at least
                                                                                                                                                                                                                                                                                                                                                                                                                                             short interfering nucleic acid; siNA; cyclin; Cytostatic; Vasotropic; cancer; cell-proliferation disorder; restenosis; drug screening; enetic engineering; pharmacogenomics; gene mapping; single nucleotide polymorphisms; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              .

New short interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer and restenosis, down regulates expression of at least
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a short interfering nucleic acid (siNA) that down regulates expression of at least one cyclin gene by RNA interference. SiNA are used to modulate expression of cyclin genes, in cells, tissue explants or organisms, e.g. for treating a wide range of cancers and other cell-proliferation disorders such as restenosis, but also for drug screening, diagnosis, target identification and validation; genetic engineering, pharmacogenomics, studying gene function and gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence represents the upper strand of cyclin D1 targeted double stranded sinh
                                                                                                                               short interfering nucleic acid; siNA; cyclin; Cytostatic; Vasotropic; cancer; cell-proliferation disorder; restenosis; drug screening; cancer; cell-proliferation disorder; restenosis; drug screening; single nucleotide polymorphisms; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    represents the upper strand of cyclin D1 targeted double strand
which is identical to the cyclin D1 transcript target sequence.
                                                                                                Upper strand of cyclin D1 targeted double stranded siNA #36.

The present invention relates to a primer set and method for mapping at least the variation/mutation part of a plant gene using a gene polymorphism marker. A mutation site of the plant gene is mapped by utilizing a genetic polymorphism marker as follows: (a) genomic DNA is prepared from a plant homozygously having a mutation to be an object of the mapping; (b) A forward primer 1 containing a base corresponding to the gene polymorphic maker of one ecotype plant, a forward primer 2 containing a base corresponding to the genetic polymorphism of the other ecotype plant and a reverse primer 3 based on the base sequence common with both the ecotype plants are prepared; (c) two kinds of oligonucleotides emitting fluorescence of different colors when the genetic polymorphism marker is detected are prepared; (d) an amplification reaction of the genomic DNA is carried out in the presence of the primers 1, 2 and 3 and the two kinds of the oligonucleotides; (e) the fluorescence intensity emitted from the resultant reactional product is detected and (f) the position on the genome of the mutation site is detected and flow the results of detection. The present sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                         A primer set and method useful for mapping at least the variation/mutation part of a plant gene using a gene polymorphism marker.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         small interfering RNA; siRNA; protein-tyrosine-phosphatase; PTP; cytostatic; immunomodulator; antimicrobial; antiinflammatory; antidiabetic; anorectic; cancer; autoimmune disease; infection; inflammation; diabetes; obesity; RNA interference; gene silencing; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

NAME OF COLORS O

```
The present invention relates to a novel Albicidin family of antibiotics produced by the expression of biosynthetic gene clusters from Xanthomonas albilineans designated as XALB1, AXLB2 and XALB3 (albicidin biosynthetic gene clusters 1, 2 and 3). The invention discloses the polynucleotide sequences of these gene clusters, and the proteins encoded by the open reading frames (ORFs) within the gene clusters. Also disclosed are methods for producing an antibiotic and protecting a plant against damage from albicidin and against phyctoxic damage. The present sequence represents a sequencing primer used in the examples of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a method of identifying a subject at risk of melanoma comprising detecting the presence or absence of one or more polymorphic variations associated with melanoma in a nucleic acid sample from a subject. Preventing melanoma in a subject comprises detecting the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        melanoma associated polymorphic variation; SNP;
single nucleotide polymorphism; cyclin-dependent kinase 10; CDK10; probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Identifying a subject at risk of melanoma, useful for treating melanoma, comprises detecting the presence or absence of one or more polymorphic variations associated with melanoma in a nucleic acid sample from a

The products of the invention have cytostatic, immunomodulator, antimicrobial, antimiflammatory, antidiabetic and anorectic activity. The methods and compositions of the present invention are useful for treating diseases or conditions associated with aberrant expression or activity of the protein tyrosine phosphatase, such as cancer, autoimmune diseases, infection, inflammation, diabetes and obesity. This sequence represents a siRNA
                                                                                                                                                                                                                                                                                                                                                                             treating diseases with aberrant activity of the protein tyrosine phosphatase, such as cancer, autoimmune disease, infection, inflammation, diabetes and obesity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Albicidin family, antibiotic production; biosynthetic gene cluster; XALB1; albicidin biosynthetic gene cluster 1; phytotoxic damage; Tn5;

Also claimed are methods for gene-silending, developing an siRNA algorithm for selecting siRNA, selecting an siRNA with improved functionality, selecting hyperfunctional siRNA, an siRNA molecule effective at silencing BAD-12, and a kit for gene silencing comprises a sequence substantially similar to a sequence consisting of GGGAGAUAGGAUGGAUGGAUGGAUGARGUA, GAAGUACCAUUAUAAG,
presence or absence of one or more polymorphic variations associated with melanoma in a nucleic acid sample from a subject; and administering a melanoma preventative to a subject in need thereof based upon the presence or absence of the one or more polymorphic variations in the nucleic acid sample. The preventative reduces ultraviolet (UV) light exposure to the subject. The methods, nucleic acids, proteins, and compositions are useful for treating melanoma. The present sequence represents a human cyclin-dependent kinase 10, CDK10, proximal SNP probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Selecting siRNA by selecting an siRNA molecule of 19-25 nucleoside bases by selecting a target gene and measuring the functionality of the nucleotide sequences that are complementary to a stretch of nucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    GUĂCGACAACCGGGAGAUĂ, AGAUAGUGAUGAAGUACAU, UGAAGACUCUGCUCAGUUU,

```
interfering RNA) comprising selecting an SINA molecule of 19-25 nucleoside bases by selecting a target gene and measuring the runcleoside bases by selecting a target gene and measuring the functionality of sequences of 19-25 nucleotides in length that are substantially complementary to a stretch of nucleotides of the target sequence. Where the functionality is dependent upon non-target specific criteria. Also claimed are methods for gene-silencing, developing an SIRNA algorithm for selecting siRNA, selecting an SIRNA will improved functionality, selecting hyperfunctional siRNA, an siRNA will improved functionality, selecting hyperfunctional siRNA, an siRNA willending comprising the siRNA. The siRNA molecule comprises a sequence substantially similar to a sequence consisting of GCGAGAUAGUAGAGUAC, UGAAGACUCCAUUUU,

CAUGCGCCCUGUUUGA, UGGAGCUCUGUUUGAUUT, GAAGAACUCCUCCAUUUU,

CAUGCGCCCUGUUUGA, udd SACACUCUGCUCGUUG. The siRNA molecule

COMPAISES a sense strand and an anti-sense strand. The siRNA molecule comprises a hairpin. The siRNA molecule comprises between 18 and 30 base siRNA and a second optimised siRNA. The method is useful in selecting
                                                                                                                                                                                                    0
comprises a hairpin. The siRNA molecule comprises between 18 and 30 base pairs. The kit comprises at least two siRNA, comprising a first optimised siRNA and a second optimised siRNA. The method is useful in selecting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Selecting siRNA by selecting an siRNA molecule of 19-25 nucleoside bases by selecting a target gene and measuring the functionality of the nucleotide sequences that are complementary to a stretch of nucleotides
                                                         siRNA for generating a gene silencing reagent. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                    Gaps

Also claimed are methods for gene-silencing, developing an siRNA algorithm for selecting siRNA, selecting an siRNA with improved functionality, selecting profunctional siRNA, an siRNA molecule effective at silencing BCl-2, and a kit for gene silencing comprising the sequence consisting of GGGAGAUGGGGAU, GAGGACAUCCACUUJ, Similar to a sequence consisting of GGGAGAUGGGAU, UGAGACCCACCAGUUJ, CAUGCGCCCUCGUUJGA, UGCGCCUCCUGUUJGA, UGCGCCUCCUGUUJGA, UGCGCCUCCUGUUJGA,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           GGAGAUGUGANGAAGUAC, and GAAGACUCGCUCAGUUUG. The sirnA molecule comprises a sense strand and an anti-sense strand. The sirnA molecule comprises a hairpin. The sirnA molecule comprises between 18 and 30 base pairs. The kit comprises at least two sirnA, comprising a first optimised sirnA and a second optimised sirnA. The method is useful in selecting sirnA for generating a gene silencing reagent. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Selecting siRNA by selecting an siRNA molecule of 19-25 nucleoside bases by selecting a target gene and measuring the functionality of the nucleotide sequences that are complementary to a stretch of nucleotides
    siRNA for generating a gene silencing reagent. The present sequence is used in the exemplification of the invention.

The invention relates to a novel method for selecting siRNA (short interferring RNA) comprising selecting an siRNA molecule of 19-25 nucleoside bases by selecting a target gene and measuring the functionality of sequences of 19-25 nucleotides in length that are sequence, where the functionality is dependent upon non-target specific criteria. Also claimed are methods for gene-silencing, developing an siRNA algorithm for selecting siRNA, selecting an siRNA with improved functionality, selecting hyperfunctional siRNA, an siRNA molecule effective at silencing Bol-2, and a kit for gene silencing comprising the siRNA. The siRNA molecule comprises a sequence substantially similar to a sequence consisting of GGGAGAUAGUGAAGUA, GAAGUACAUCAGUAGUAG, GAAGUACAUCAGUAGUAG,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CAUGCGGCCUCUGUTUCA, UCCGGCCUCUGUTUGAUUT, GAGAUGCGGCUCUGUTUCA, UCCGGCCUCUGUTUCA, UCCGGCCUCUGUTUGAUUT, GAGAUGCGAGUGAGGTGCA, COGGCCUCUGUTUGAUUT, GAGAUGCGAGUGAGGTGCA, and GAAGACUCUGGUCAGUTUG. The siRNA molecule comprises a hairpin. The siRNA molecule comprises between 18 and 30 base pairs. The kit comprises at least two siRNA, comprising a first optimised siRNA and a second optimised siRNA. The method is useful in selecting siRNA for generating a gene silencing reagent. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Selecting siRNA by selecting an siRNA molecule of 19-25 nucleoside bases by selecting a target gene and measuring the functionality of the nucleotide sequences that are complementary to a stretch of nucleotides
                                                                                                                                                                                                                                                                                                                                          ss; siRNA; gene silencing; Bcl-2; optimised; short interfering RNA; RNA interference; firefly; luciferase.

pairs. The kit comprises at least two siRNA, comprising a first optimised SiRNA and a second optimised siRNA. The method is useful in selecting siRNA for generating a gene silencing reagent. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Selecting siRNA by selecting an siRNA molecule of 19-25 nucleoside bases by selecting a target gene and measuring the functionality of the nucleotide sequences that are complementary to a stretch of nucleotides

The invention relates to antisense compounds, compositions and methods for modulating the expression of PCTAIRE protein kinase 1 (also known as PCTAIRE). The antisense oligomuclecide is useful for treating an animal having a disease or condition associated with PCTAIRE protein kinase 1, particularly a hyperproliferative disease or a neurological disease. These diseases include thrombocytopaenia, mental neurological disease. These diseases include thrombocytopaenia, mental retardation, Miskott-Aldrich syndrome, retinitis pigmentosa, dystonia with Parkinsonism, sideroblastic anaemia, X-linked Charcot-Marie-Tooth disease, or incontinentia pigmenti. The antisense oligonucleotide is particularly useful for inhibiting the expression of PCTAIRE protein kinase I in cells or tissues. It is useful for diagnostics, prophylaxis, or as research reagents or kits. The present sequence is an antisense oligonucleotide targetted to human PCTAIRE protein kinase I DNA. This
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   sequence is used to illustrate the method of the invention

The present invention relates to antisense compounds targeted to a nucleic acid encoding G protein-coupled receptor (GPCR) kinase 6 (GRK6). The antisense compound comprises an antisense oligonuclectide that specifically hybridises with the nucleic acid and inhibits the expression of GRK6. The antisense oligonuclectide comprises at least one modified internucleoside linkage, preferably a phosphorothicate linkage. It also comprises at least one modified internucleoside linkage, preferably a phosphorothicate linkage. It also comprises at least one modified sugar moiety, preferably a 2'-O-methoxyethyl (2'-MOE) sugar moiety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonuclectides are useful for the treatment of diseases such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New compounds, particularly antisense oligonucleotides targeted to a nucleic acid encoding G protein-coupled receptor (GPCR) kinase 6, useful for treating diabetes, drug addiction, uterine contractility and

The present invention relates to antisense compounds targeted to a nucleic acid encoding G protein-coupled receptor (GPCR) kinase 6 (GRK6). The antisense compound comprises an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits the expression of GRK6. The antisense oligonucleotide is a chimeric oligonucleotide. The antisense oligonucleotide is ne modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified internucleoside linkage in the specified sugar moiety, preferably a 2'-0-methoxyethyl (2'-MOE) sugar moiety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide are useful for the treatment of diseases such as rhematoid arthritis, drug addiction, uterine contractility, hypertension, and diseases or conditions arising from aberrant haematopolesis. The present sequence represents a human GRK6 DNA target sequence for an antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            .

rheumatoid arthritis, drug addiction, uterine contractility, hypertension, and diseases or conditions arising from abetrant haematopoiesis. The present sequence represents an antisense oligonucleotide used in the examples of the present invention.

Sequence 20 BP; 6 A; 8 C; 5 G; 1 T; 0 U; 0 Other;

```
This probe specifically hybridises to the wild-type TagI restriction corresponding to nucleotides 2508-2511 of human Ha-ras. It is used for quantitative determination of a specific region of the c-Ha-ras following PCR amplification with nested primers of the target sequence from cells treated with the carcinogen ethylnitrosurea. A set of 12 probes are also used in the plaque hybridisation which differ only in the sequence at the TagI site in order to detect the 12 possible base-pair mutations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   polymerase chain reaction; PCR; nested primer; mutation; screening;
                                                                                                                                                                                                                                                                                                                                                                              Quantitative determination of DNA sequences - contg. mutationally eliminated restriction site(s), chain reaction using polymerase amplification and elimination of wild-type sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Probe to mutant sequence #6 of exon 3 of human c-Ha-ras gene.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This is one of 12 probes which differ only in the sequence at the TagI site in the wild-type c-Ha-ras corresponding to nucleotides 2508-2511. The "mutant" probes are used to detect the 12 possible base-pair mutations potentially induced by treatment of cells with the carcinogen ethylnitrosurea. (Updated on 25-MAR-2003 to correct PI field.)

                                                                                                                                                                                                                                                               This is one of 12 probes which differ only in the sequence at the TagI site in the wild-type c-Ha-ras corresponding to nucleotides 2508-2511. The "mutant" probes are used to detect the 12 possible base-pair mutations potentially induced by treatment of cells with the carcinogen ethylnitrosurea. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Detection of Gaucher's disease - by screening DNA for a substitution of adenine for guanine at position 1 of gluco:cerebrosidase gene intron 2.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                PCR primer. The oligonuclectide can be used for polymerase chain reaction (PCR) amplification of DNA, specifically regions of specific genes that are conserved among mammalian species, i.e. pairs of oligonuclectides from the present specification represent universal mammalian sequence-tagged site (UM-STS) primers. The primers are used to develop genomic amps, to isolate clones from libraries, to make cross-species comparisons and to develop additional genetic markers. UM-STS allow genomic comparisons to be made between more species
                                                                                                                                                                                                                                                                                                                                                                                                                                 New oligonucleotide primers amplifying gene regions conserved among mammals - useful for developing genomic maps, isolating clones and making cross-species comparisons.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence represents a specifically claimed oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            little spermatozoa in the semen) or to assess the genotype of infants of phenotypically ambiguous sexuality. The method can also be used in diagnosis and quality control (kits are provided within the scope of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAT68355-T68368 are a set of primers used in a method for assessing the integrity of a Y chromosome. The primers are capable of priming the chromosome loci: DYF53S1, DYS229, DYZ1, DYS230, DAZ(3), DAZ(4), DAZ(5) and MIC2. The method can be used to rapidly and reproducibly assess the integrity of specific regions of the Y chromosome that are associated with male fertility. It can be used to assess the integrity of the Y chromosome in males exhibiting azoospermia or oligospermia (no or very

especially used in gene therapy of a symptomatic or presymptomatic patient. The method comprises providing a functional huntingtin gene with a (CAG)n repeat of the normal range of 11-34 copies, or an antisense sequence, to the desired cells of the patient, in a manner that permits the expression of the huntingtin protein provided by the gene, or inhibits expression of the mutated huntingtin gene, for a time and in a quantity sufficient to provide the huntingtin function to the cells of

Sequence 20 BP; 6 A; 3 C; 6 G; 5 T; 0 U; 0 Other;

PCR primers AA197941-42 were used to create a 210 bp probe for transcripts of a novel gene, termed huntingin or IT15. The huntingtin reading frame contains a polymorphic (CAG)n trinucleotide repeat with at least 17 alleles in the normal population, varying from about 11 to 34 CAG copies. Huntington's disease (HD) is a progressive neurodegenerative disorder characterised by motor disturbance, cognitive loss and psychiatric manifestations. The genetic defect causing HD is assigned to chromosome 4. On HD chromosomes, the length of the trinucleotide CAG repeat is substantially increased, e.g. about 37 to at least 73 copies. The huntingtin gene and proteins encoded by it, may be used for the diagnosis or treatment of Huntington's disease. The huntingtin gene is

AAX09121-X10268 are allele-specific oligonucleotide primers used in the isolation of various biallelic polymorphic markers found in the human genome (represented in AAX10926-X1293). These primers can be used in a method for determining polymorphic forms in an individual for use in e.g. forensics, paternity testing or for phenotypic typing for diseases such as agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular hypercholesterolemia, polycystic kidney disease, hereditary spherocytosis, von Millebrand's disease, hereditary spherocytosis, von Millebrand's disease, tubercous solerosis, hereditary specrofytosis, von Millebrand's disease, tubercous solerosis, hereditary spherory is lasses, inflammation, cancer, diseases of the nervous syndrome, osteogenesis imperfecta, acute intermittent porphyria, autocimune diseases, inflammation, cancer, diseases of the nervous system, infection by pathogenic microorganisms, and characteristics such as longevity, appearance (e.g. baldness, obesity), strength, speed, endurance, fertility, and susceptibility or receptivity to particular drugs or therapeutic treatments. The isolated polymorphic nucleic acid expeditation as lose to produce medicaments for the treatment or prophylaxis of such diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ss; Human; double-stranded adenosine deaminase; neurological disorder;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ó,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAT68369-T68381 and AAT70842 are a set of primers used in a method for assessing the integrity of a Y chromosome. The primers are capable of priming the chromosome loci: SMCY, DYS210, DYS220, DYS213, DYS7, DYS237, DYS215, MIC2 and DAZ16) and MIC2. The method can be used to rapidly and reproducibly assess the integrity of specific regions of the Y chromosome that are associated with male fertility. It can be used to assess the integrity of the Y chromosome in males exhibiting azoospermia or oligospermia (no or very little spermatozoa in the semen) or to assess the genotype of infants of phenotypically ambiguous sexuality. The method

DRADA is specific for double-stranded RNA and is useful for the diagnosis of disorders characterised by inappropriate double-stranded ribonucleic acid adenosine deaminase expression. Particularly for diagnosis of certain neurological or CNS disorders, e.g. Alzheimer's disease, Huntington's disease, subacute sclerosing parencephalitis, measles inclusion body encephalitis or stroke, or other neurological conditions associated with aging. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       PCR primers AAV42472-511 are used in a method for assessing the integrity of a Y chromosome. Genomic DNA, or blood, from a subject is combined with several distinct oligonucleotide primer pairs capable of simultaneously priming several human Y chromosome loci which are linked to normal
                                                                                                                                                                                                                                                                           The primers AAV27072-V27099 were used in the isolation, amplification and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Assay, Y chromosome, Y chromosome loci, human, male fertility, detection, deletion mutation; male infertility, PCR primer; ss.
Diagnosis of disorders characterised by inappropriate expression of enzyme - comprises contacting tissue sample with labelled antibodies, oligonucleotides or protein reagent and measuring association of enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Assessing Y chromosome integrity in predicting human male infertility by amplifying specific regions of human Y chromosome linked to normal fertility by multiplex PCR and detecting deletion mutations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

Primers AAV05845-46 were used to amplify a 210 bp fragment of the human huntingtin gene (AAV05828) for the analysis of a translocation breakpoint at locus (14;12), which disrupts the Huntington's disease (HD) gene. The huntingtin protein, or the gene encoding it, is useful for detecting a predisposition to develop HD, for diagnosis and treatment of HD,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    PCR primers AAV42472-511 are used in a method for assessing the integrity of a Y chromosome. Genomic DNA, or blood, from a subject is combined with several distinct oligonucleotide primer pairs capable of simultaneously priming several human Y chromosome loci which are linked to normal fertility in human males. The present primer pair (AAV42508-09) amplify amplified chromosomal DNA fragments which are isolated and compared with those from normal male subjects. The method is useful to detect deletion mutations on a Y chromosome which are predictive of human male
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Assay, Y chromosome, Y chromosome loci, human, male fertility, detection, deletion mutation; male infertility, PCR primer; ss.
fertility in human males. The present primer pair (AAV42486-87) amplify loci DYZ1. The primer pairs are amplified by multiplex PCR, yielding amplified chromosomal DNA fragments which are isolated and compared with those from normal male subjects. The method is useful to detect deletion mutations on a Y chromosome which are predictive of human male
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Assessing Y chromosome integrity in predicting human male infertility by amplifying specific regions of human Y chromosome linked to normal fertility by multiplex PCR and detecting deletion mutations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

This sequence represents a PCR primer for the human ACE (angiotensin converting enzyme) gene, and can be used in the method of the invention. The method is for assessing cardiovascular status in humans by determining the sequence at a least one polymorphic site in the ACE (angiotensin converting enzyme), AGT (angiotensinogen) and/or ATI (type 1 angiotensin I receptor) genes, and comparing the polymorphic pattern with that in patients with predetermined markers of status. The method is used to assess blood pressure or electrocardiographic profile, to diagnose a cardiac condition such as (silent) myocardial infarction (MI), hypertension, arberosclerosis or stroke. They can also be used to predict response to treatments with ACE inhibitors, angiotensin II receptor antagonists, diuretics, alpha- or beta-adrenergic receptor antagonists, contaginates of nucleic acids containing polymorphic positions in the genes, and libraries of targets corresponding to the peptides from the genes are used to screen for cardiovascular agents. The nucleic acids contained in the library can be is used as source of probes
                                                                                                                                                                                                                                                                                                                                                                                           Assessing cardiovascular status in humans by polymorphic analysis - of agenes for angiotensin converting enzyme, angiotensinogen and angiotensin II receptor, used to diagnose predisposition to disease and to predict effect of therapy.
                                                                                                                                                                                                                                                                                                          Norberg LT, Andersson MK, Lindstroem PHR;

                                                                                                                                                                                                                               oligonuclectides with a base sequence complementary to the CXCR4 or CCR5 genes. Such inhibitors can be formulated into drug compositions for prevention or treatment of HIV infection, with inhibition of expression of CXCR4 or/and CCR5 gene. Sequences AAZ31307-362 represent antisense oligonuclectides to the CXCR4 gene
                                                                                                                                                Antisense oligonucleotide-based HIV cofactor inhibitors, as drug compositions for treatment of HIV infection.
                                                                                                                                                                                                                                                                                                                                                                           .
                                                                                                                                                                                                                 The invention provides HIV cofactor inhibitors that contain

Delivering tissue kallikrein and atrial natriuretic peptide to a cell for prevention and treatment of non-hypertension-associated renal and cardiac disorders. Example 1; Page 63; 120pp; English.

This invention describes a novel method for delivering tissue kallikrein and atrial natriuretic peptide to a cell which can be used in the treatment of non-hypertension-associated renal and cardiac disorders. Non hypertension-associated renal induct, nephrotoxicity, nonhypertension-associated renal disease, salt-induced renal damage, glomerulosclerotic lesions, tubular injury, drug-induced renal damage, chronic renal failure, nephrotic syndrome and diabetic nephrotoxophy, and non-hypertension-associated cardiac disease, heart cardiac hypertrophy, nonhypertension-associated cardiac disease, heart

           infarction, myocardial ischemia, congestive heart failure and restenosis following angioplasty. The encoding nucleic acids can also be used for preventing and or treating the following: cerebrovascular disorders, occlusive artery disorders e.g. restenosis, renal damage and/or renal injury caused by drug induced and/or salt-induced nephrotoxicity and and/or inhibiting neointimal formation in blood vessel and stimulating renal tubular regeneration and/or reversing pre-existing renal injury
                                                                                                                                                                                                   Gaps

Example 1; Page 63; 120pp; English.

This invention describes a novel method for delivering tissue kallikrein and atrial natriuretic peptide to a cell which can be used in the treatment of non-hypertension-associated renal and cardiac discorders. Non-hypertension-associated renal injury, non-pertension-associated renal disease, salt-induced renal damage, glomerulosclerotic lesions, tubular injury, drug-induced renal damage, chronic renal failure, nephrotic syndrome and diabetic nephrotrophy, and non-hypertension-associated cardiac disorders include cardiac hypertrophy, nonhypertension-associated cardiac disease, heart failure after cardial ischemia, congestive heart failure and restenosis

sensor arrays, where each array comprises a unique probe oligonucleotide, which is the reverse complement of part of a unique probe oligonucleotide, which is the reverse complement of part of a unique probe oligonucleotide present in a mixture of target deletion sequence oligonucleotide present in a mixture of target deletion sequence oligonucleotide present of in a mixture of target deletion sequence oligonucleotides which are labelled and hydroligize with the probe oligonucleotides which are labelled and oligonucleotides and their targets are represented in AAX23548.X23709. Oligonucleotides characterized by the method form pharmaceutical compositions that are useful for modulating cellular adhesion or proliferation, and being active against a eukaryotic pathogen, a human retrovirus, a human immunodeficiency virus (HIV), or a non-human retrovirus, including influenza virus, Epstein-Barr virus, Respiratory Syncytial Virus or cytomegalovirus (CMV). The compositions enable characterization of deletion sequence oligonucleotides having related, but different nucleobase sequences, and quantification of different sequence ("target") oligonucleotides in a mixture.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  .;

Also, if the specificity of the oligonucleotide's nucleobase sequence for its reverse complement is not modified, the method may be performed using oligodeoxynucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAX91991-X97517 represent PCR primers used to amplify open reading frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae (See AAX91990). C. pneumoniae causes respiratory disease such as pneumonia and bronchidis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent ottis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAX34584 - AAX35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae especially where the vector directs the expression of a neutralising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

                                                                                                                                                                                                                                                                                                                                                                                                        and other nucleic acid sequences from the genome of Chlamydia pneumoniae (see AAX91990). C. pneumoniae causes respiratory disease such as pneumoniae and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34584-AAY35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae mucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae
                                                                                                                       Respiratory disease; pneumonia; bronchitis; heart disease; sarcoidosis; sinusitis; purulent otitis media; erythema nodosum; pharyngitis; vaccine; neutralising epitope; PCR primer; ss.

The present invention describes isolated mucleic acid molecules (A)

cncoding mutant CD36 proteins (B). Parasites such as Plasmodium

cnc falciparum (the major cause of malaria) are unable to utilise the mutated

proteins to gain entry to, and infect cells. The mutant CD36 proteins do

colls. The nucleic acids may be used for the recombinant production of

mutant CD36 proteins according to standard methodologies. They may be

cused in this way to prevent and treat parasitic infections that utilise

cused in this way to prevent and treat parasitic infections that utilise

the CD36 protein to infect cells, such as P. falciparum, the major cause

cof malaria. For example, the protein may be used to identify modulators

of CD36 expression and activity or a patient's CD36 DNA may be screened

cof cD36 expression and activity or a patient's CD36 DNA may be screened

cof cD36 expression and activity or a patient's CD36 DNA may confer

cresistance to parasitic infections. The proteins and nucleic acids may

calso be used to prevent, diagnose and treat diseases associated with

defects in insulin action and/or glucose metabolism and/or tatty acid

cometabolism and/or catecholamine action in subjects possessing mutations

crepresent nucleotide and amino acid sequences respectively which are used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human biallelic marker upstream amplification primer SEQ ID NO:7238.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Nucleic acids encoding mutant CD36 proteins useful for preventing, diagnosing and treating parasitic infections, especially malaria.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human genome; biallelic marker; high density disequilibrium map; genomic map; haplotype; phenotype; polymorphic base; genotyping; haplotyping; hybridisation; identification; characterisation;
